

C++ → Inheritance

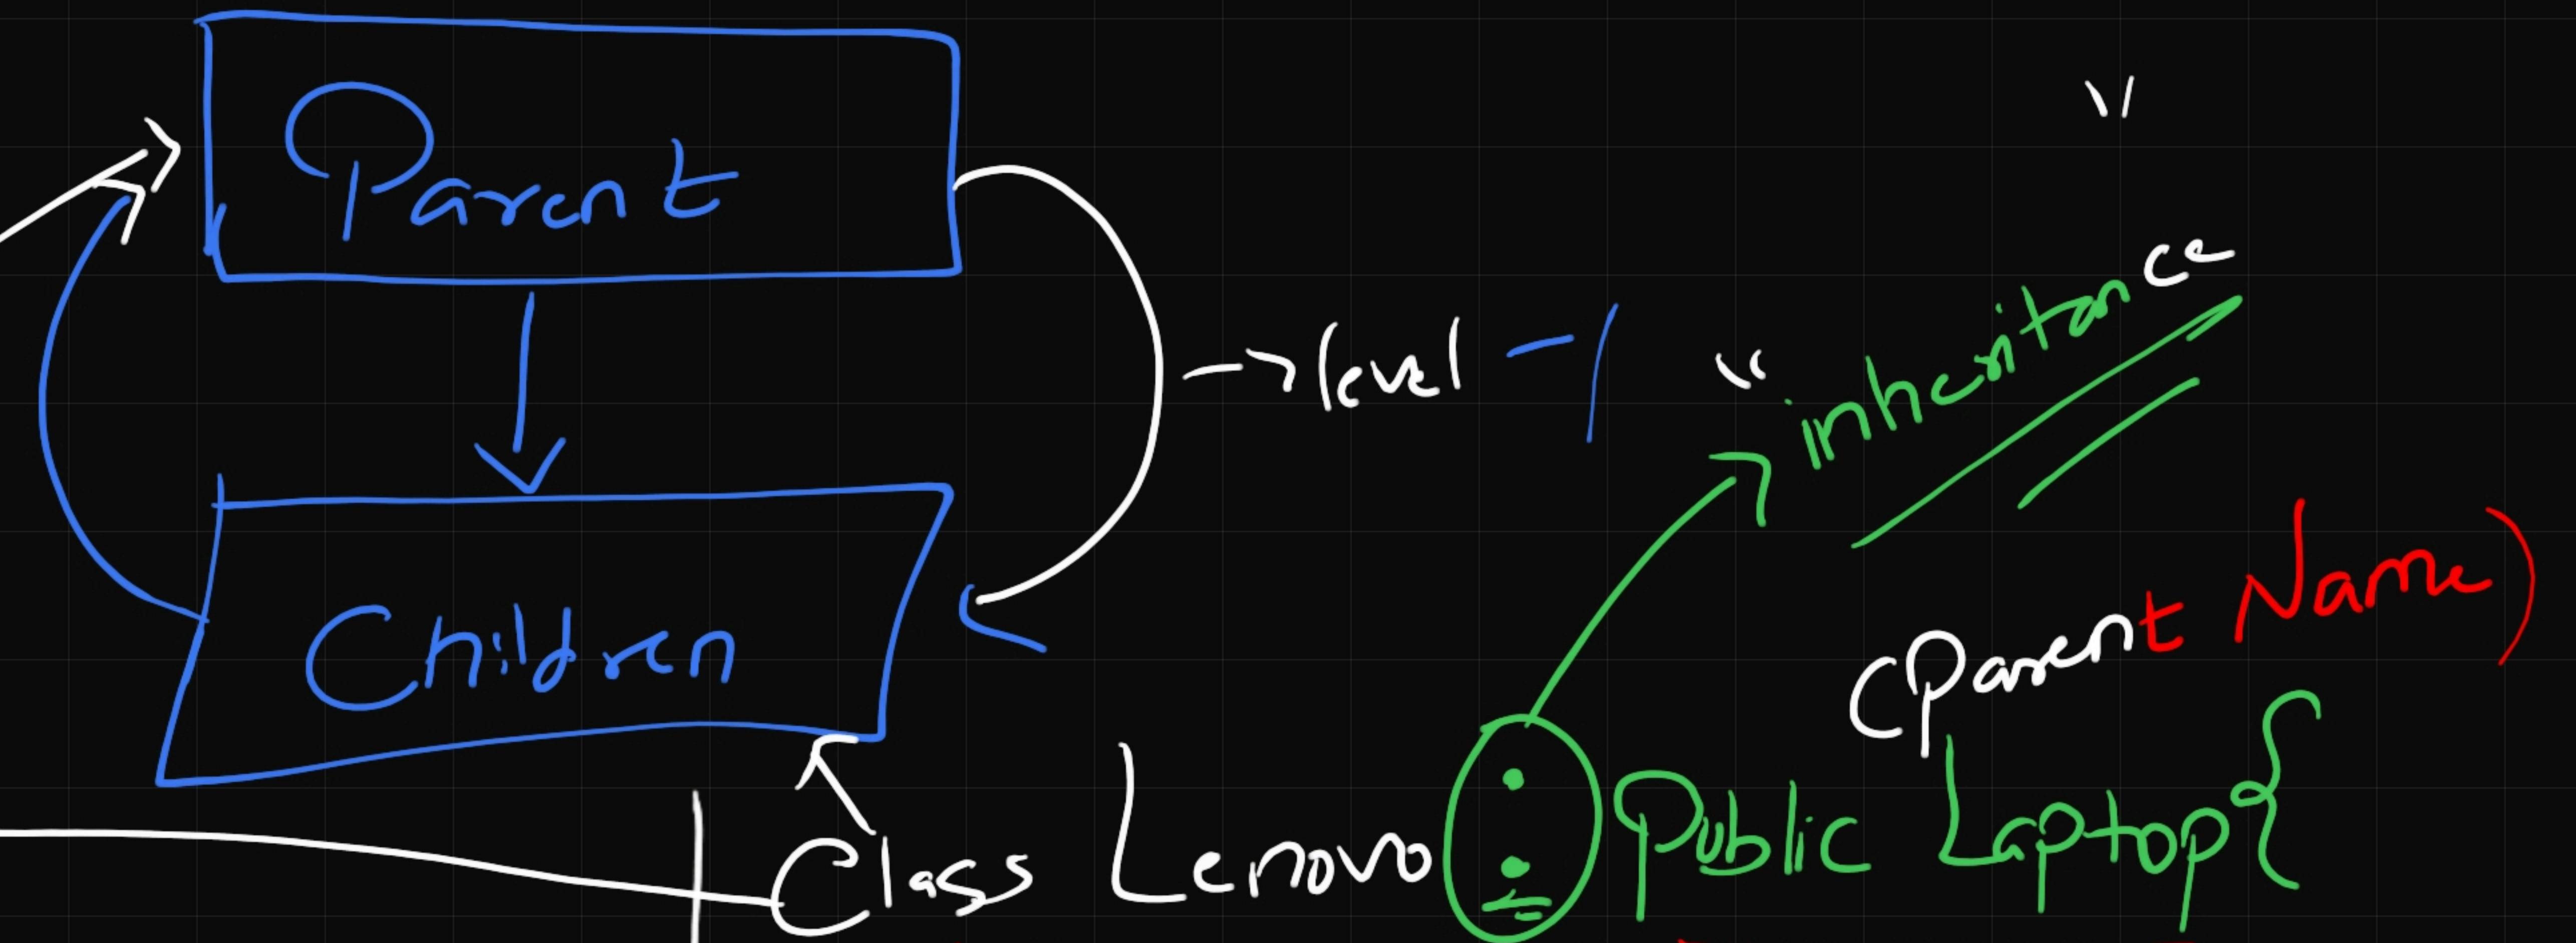

"It is a powerful feature use to make a Parent & it's

Child Class where all the common ^(members) Properties must-
be declare in Parent class & only distinct

Property should be there in Child class."

↳ Reusability (Child class) → Can access it's distinct properties
→ And also common members which is
Present in Parent
Class.

① Single Inheritance :-

Eg- Class Laptop {

// Common Data Members....

String Ram; ✓

String Storage; ✓

String display; ✓

// Common Function Members...

void display (str, str, str)

};

Class Lenovo (:) Public Laptop {

// Distinct Properties....

String RamVersion;

String Storage_type;

String display_type;

// Distinct Function...

void displayI() {

};

```
Class Parent {  
    → Parent() {  
    }  
}  
Class Child extends Parent  
{  
    Child() { Super();  
    }  
}
```

XIS →

C++

```
Class Child : Parent  
{  
    Child() {  
        Parent()  
        Super()  
    }  
}
```
