

↓ "Entity"
~> Object Oriented Programming → "Platform Independent Language"
C++

* Problem → Real-World Entity/Problem

Student (No-^{→ skeleton} responsibility)
→ 120

I → Data member (5)
· → Function member (4)
4
·
120

→ Exist
· Space occupy
· Character (5)
· Functionality (4)

oops

- { ① Class
- { ② Object
- ③ Constructor
- ④ Destructor
- ⑤ Function

- ⑥ Inheritance
- ⑦ Access Modifier
- ⑧ Abstraction
- ⑨ Encapsulation
- ⑩ Polymorphism

- ① Class -
- ① It is a blueprint / skeleton of an object (Particular Entity)
 - ② It is a "keyword" to define a Members → Data Members ✓
+
Function Members ✓
 - ③ It never consume any space (Memory) ✓

Structure

```
struct Student {  
    String name;  
    int age;  
    String address;  
};
```

Class

```
Class Student {
```

Data member

```
    String name;  
    int age;  
    String address;
```

Function member

```
    void display();
```

~> Student (s1);

s1 -> "Soni"
s2 -> "Pooni"
s2 display()
x12 -> name
