

Heap (Tree)

→ Max-Heap (parent)

↳ Every individual node must be greater/equal to its children node.

→ Min-Heap

↳ Every individual node must be smaller/equal to its children nodes

Max-heap $\rightarrow$ Parent Element $\geq$ Children Element
 Insetion: L to R
 Arr = [10, 28, 32, 16, 48, 52] { DSA }

Min-heap $\rightarrow$ Parent Element $\leq$ Children Element

arr = [11, 18, 2, 48, -12, 53]

Task 1 : Create ^a STL: Vector (Size) ^{the} → take ^{an} Size input from ^{an} User,
insert ^{an} elements ^{where you will} take ^{the} value from ^{an} User-side,
Using ^a STL: algorithm ^{Perform an} accumulate ^{Method to} the total
elements, find ^{the} max, min-element, Sort the "Vector",
Reverse it. Then Store ^{the} total accumulate value,
min & max element, final Vector elements inside
a "Output.txt".
